Auxiliary Systems

New in Release 2026.09.3, September 2026.

Many of the buildings you already inspect have devices that are wired to the alarm or to their own receiver but are not fire devices: a panic button under a counter, a water sensor in a boiler room, a freeze sensor in a walk-in cooler. Until now there was nowhere to put them. Auxiliary Systems inspects them, and it works like every other service you already run.

> It is already switched on for your company, and it costs nothing extra. If you do not do this work, untick **Auxiliary Systems** in **Settings > General > Services** and it disappears.

Three device types, each with its own checks

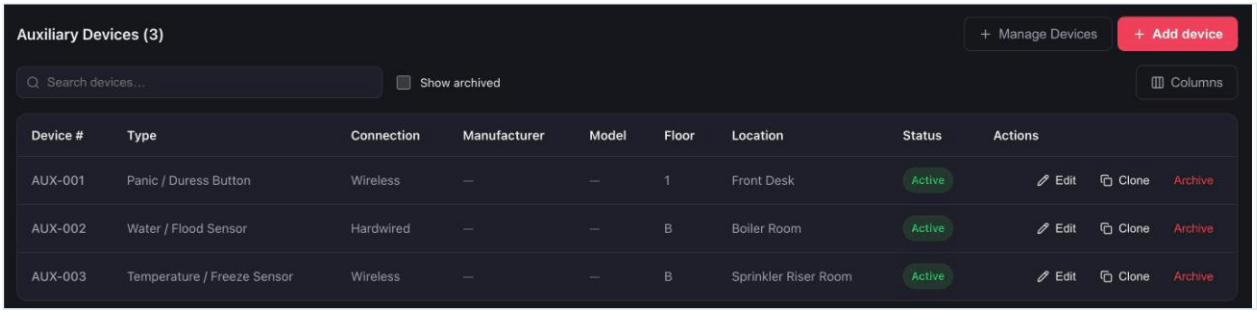

The device type decides what the technician is asked, so nobody is ever asked whether a flood sensor was pressed:

- **Panic and duress buttons.** Activated by pressing.
- **Water and flood sensors.** Activated by applying water.
- **Temperature and freeze sensors.** Activated by a temperature test.

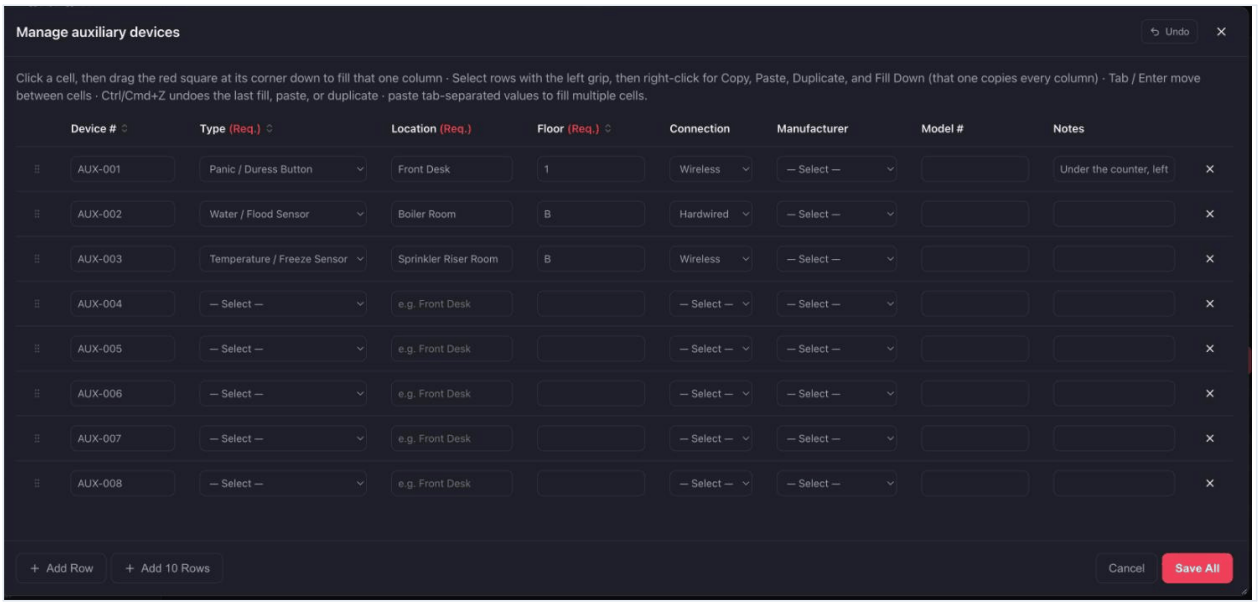

Adding your devices

Tick **Auxiliary Systems** on the property and set its frequency, fee and technician, the same as any other service. An **Auxiliary Systems** tab appears.

- **Add device** for one at a time.
- **Manage Devices** for a whole building in one grid.
- Each device takes its type, its location, and its floor on a multi-floor property. Connection, manufacturer, model and notes are there if you want them.

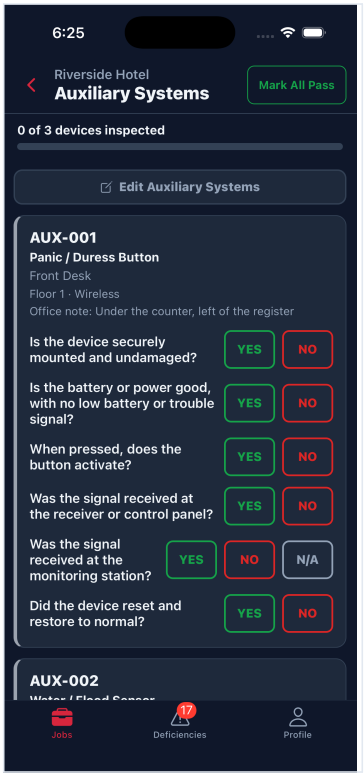

The property's Auxiliary Systems tab, with its devices.

Manage Devices: a whole building in one grid.

On the phone

Six checks per device. Anything answered NO opens a deficiency on the spot, with photos, exactly like your fire alarm work. The app keeps working with no signal and syncs when it gets back online.

A device on the phone, with the checks for its type.

The report

Auxiliary gets its own report: the device list, every check per device, and the deficiencies with their photos. If a technician does auxiliary and fire alarm at the same building on the same day, both can go out as one combined PDF.

> These devices are not covered by an NFPA standard, so the report certifies that the work was performed in accordance with the manufacturer's instructions.

Everything else it plugs into

- Scheduling and the dispatch board.
- Invoices, with its own line and fee.
- Recurring Inspection Revenue and the due lists on the dashboard.
- Technician qualifications, so only people you have marked as qualified are offered the work.
- The in-app Guide, office and phone.
